Hall effect

EXPERIMENT - 7

Aim - To estimate the Hall coefficient, carrier conc. and their mobility in Ge crystal using Hall effect

APPARATUS - Hall effect set up a) Hall probe (Ge crystal) b) Hall probe (In As) for measuring magnetic field, Digital Milliammeter, constant current power supply, Electromagnet, EMV-75, Gauss meter, G.M-101

THEORY - A static \vec{B} has no effect on charges unless they are in motion when the charges flow, a \vec{B} directed \perp to the direction of flow produces a mutually \perp force on the charges when this happens e^- and holes will be separated by opposite forces they will in turn produce an \vec{E} known as Hall's effect. In metals and heavily doped semiconductors where one type of carrier dominates, the force due to Lorentz force is balanced by the force on the charge carriers due to Hall field

$$q E_H = q (v \times H) \quad (v \rightarrow \text{drift vel. of carrier})$$

$$J = q n v \quad (q \rightarrow \text{charge of carrier})$$

$$(n \rightarrow \text{carriers conc.})$$

$$R_H = E_H (J \times H) = \frac{1}{nq}$$

R_H = Hall coefficient and depends on the free charge carrier density (n) for a given material. Let us consider a semiconductor material in the form of a bar having dimensions x, y, z . Let J is direction along x

and H is along Z and E_H will be developed across Y

$$R_H = \frac{E_H}{J_H} = \frac{V_H / Y}{\left(\frac{I}{Y_Z}\right) n} = \frac{V_H Z}{I n}$$

finally $R_H = \frac{1}{nq}$

From this eq. it is clear that the sign of Hall coefficient depends upon the sign of the q . This means in a p -type ~~semiconductor~~ specimen R_H would be positive and in a n -type it would be negative. When it comes to one charge carrier, the conductivity is given by:-

$$\sigma = nq\mu$$

$$\mu = \text{mobility of charge carrier} = \sigma R_H$$

R_H is expressed in cm^3/C

σ in $\text{ohm}^{-1}\text{cm}^{-1}$

\therefore it is expressed in $\text{cm}^2 \text{V}^{-1}\text{s}^{-1}$ and carrier n is given by:-

$$n = \frac{1}{R_H q}$$

CALCULATION/RESULTS

$R_H q$

(i) Part I: Magnetic Calibration

From the graph of μ vs I_m , we get a straight line

$$\mu = m(I_m) + c$$

Maths

$$\frac{5}{12} = \frac{N}{12} = \frac{3}{12}$$

$$\frac{1}{2} = \frac{1}{2}$$

Can be used to find the area of a triangle if the base and height are known. The area of a triangle is given by the formula $A = \frac{1}{2}bh$ where b is the base and h is the height.

$$A = \frac{1}{2}bh$$

Can be used to find the area of a triangle if the base and height are known.

$$A = \frac{1}{2}bh$$

Can be used to find the area of a triangle if the base and height are known.

Can be used to find the area of a triangle if the base and height are known.

$$A = \frac{1}{2}bh$$

Maths

Q. 1. Find the value of x if $\frac{1}{x} + \frac{1}{y} = \frac{1}{z}$

$$\frac{1}{x} + \frac{1}{y} = \frac{1}{z}$$

$$\frac{1}{x} = \frac{1}{z} - \frac{1}{y}$$

For this we take LCM of x, y, z which is xyz .
Multiplying both sides by xyz , we get
 $yz + xz = xy$
 $yz + xz - xy = 0$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$yz + xz - xy = 0$$

$$A = 1522.1 \times 10^{-4} + 151.43$$

$$m = 1522.1 \quad c = 151.43$$

(ii) Part II: Measurement of constant sample current.

using V_H vs H

$$R_H = \frac{V_H Z}{I_s} = I_s = 8 \text{ mA} \quad Z = 0.05 \text{ cm}$$

$$\text{slope} = \frac{V_H}{H} = 0.0235$$

$$R_{H1} = \frac{0.0235 \times 0.05}{8} = 1.46875 \times 10^{-4} \text{ cm}^3/\text{C}$$

(iii) Part III: Measurement of Hall Voltage at const \vec{B}

Using V_S vs I_s

$$H = 6000 \text{ G}$$

$$R_H = \frac{V_S Z}{I_{SH}}$$

$$Z = 0.05 \text{ cm}$$

$$\text{slope} = \frac{V_S}{I_s} = 19.093$$

$$R_{H2} = \frac{19.093 \times 0.05}{6000} = 1.591083 \times 10^{-3} \text{ cm}^3/\text{C}$$

RESULTS

(a) Hall coefficient

$$R_H = \frac{R_{H1} + R_{H2}}{2} = \left[\frac{1.46875 + 1.591083}{2} \right] \times 10^{-4}$$

$$R_H = 1.5299165 \times 10^{-4} \text{ cm}^3/\text{C}$$

(b) carrier conc. (n)

$$n = \frac{1}{R_H q} = \frac{1}{1.5299165 \times 10^{-4} \times 1.6 \times 10^{-19}} = 4.0852 \times 10^{22} \text{ cm}^{-3}$$

$$n = 4.0852 \times 10^{22} \text{ cm}^{-3}$$

(c) Mobility of charge carriers

$$\mu = \sigma R_H$$

$$\sigma = \frac{1}{\rho} \Rightarrow \rho = 8 \text{ cm}$$

$$\therefore \mu = \frac{R_H}{\rho} = \frac{1.5299165 \times 10^{-4}}{8}$$

$$\mu = 1.91239 \times 10^{-5} \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$$

PRECAUTIONS

- 1) Handle the equipments carefully
- 2) Offset the B on the probe
- 3) Set the digital gauss meter to zero to avoid errors
